PROFESSIONAL SUMMARY

MSc Data Science graduate (University of Surrey, Merit — graduated Sept 2025) with hands-on experience delivering production-grade analytics. Built a live ML-backed forecasting app, a 100K-row SQL-to-Power BI pipeline, and a real estate pricing engine that cut MAE by ~50% through systematic feature engineering. Comfortable taking data from raw to decision-ready — not just building models, but building systems people can rely on. Also working with agentic AI systems and custom MCP server development.

WORK EXPERIENCE

Data Analyst Intern ↗ [Link](#)

Mar 2025 – Present

Unified Mentor Pvt Ltd · Remote

- Restructured a flat-file workflow into a normalised PostgreSQL schema across five tables (customers, orders, products, sellers, reviews) — enabling indexed, sub-second queries on **100K+ rows** across a fully relational data model.
- Engineered net-new business metrics (revenue, profit margin, AOV, purchase frequency) in PowerBI, and using Python/Pandas across multi-stage cleaning — resolving nulls, format inconsistencies, and duplicate records absent from source data.
- Applied Market Basket Analysis to surface high-frequency product co-purchase pairs; translated association rules into cross-sell recommendations **adopted directly by the commercial team**.
- Delivered a multi-page Power BI dashboard consolidating **8+ KPIs** across sales, margin, category contribution, churn, and basket behaviour — replacing siloed reports across three teams with a single source of truth.

PROJECTS

Customer Engagement & Product Utilisation Analytics — Retention Strategy ↗ [Link](#)

April – May 2026

Python · Pandas · Plotly · Streamlit · Scikit-learn · Statistical Analysis · Behavioural Analytics

- Conducted a **5-phase behavioural retention analysis** across **10,000 European Central Bank customers** (France, Germany, Spain) — classifying customers into 4 engagement profiles and identifying that inactive customers churn at **1.90× the rate of active customers**, surfacing behavioural churn signals invisible to standard financial screening.
- Quantified that moving a customer from 1 to 2 products reduces churn from **27.71% to 5.56% among active members** — identified and flagged **115 at-risk premium customers** (high balance + inactive + single-product) churning at 35.65% — a segment undetectable by balance-only monitoring.
- Engineered a composite **Relationship Strength Index (RSI)** from 4 normalised signals (activity, product depth, balance, tenure); diagnosed **age as a confounding variable** driving 51.12% churn in the 46–60 cohort; delivered an interactive Streamlit dashboard with live filters and a government-grade executive summary report.

Nassau Candy Distributor — Supply Chain & Shipping Analytics ↗ [Link](#)

Mar - April 2026

Python · Pandas · NumPy · SciPy · Plotly · Streamlit · Statistical Modelling

- Analysed **8,549 shipments** across 5 factories, 4 regions, and 4 shipping modes — engineered a composite efficiency score combining normalised lead time and delivery variability to rank all 16 factory→region routes and identify bottleneck routes across 6 analytical dimensions.
- Uncovered that **expedited shipping (Same Day) delivers no meaningful speed advantage** over Standard Class (13.3 vs 13.1 day average lead time) — a counter-intuitive finding surfaced through statistically rigorous Z vs t-distribution confidence intervals, with all thresholds set from data-driven percentile analysis rather than hardcoded values.
- Resolved significant real-world data quality issues including corrupted ship dates, cart-update duplicate orders, and product misclassification — delivering a clean three-way merged dataset and a fully interactive Streamlit dashboard with live filters across region, ship mode, date range, and lead-time threshold.

End-to-End Demand Forecasting System ↗ [Link](#)

July – Aug 2025

Python · XGBoost · FastAPI · PostgreSQL · Docker Compose · Streamlit · Neon

- **36% MAE reduction** (110 → 70) over baseline through systematic feature engineering — designed a productiongrade forecasting system across three decoupled, containerised services: model execution, FastAPI inference, and Streamlit visualisation, orchestrated with Docker Compose and **deployable in one command**.
- Optimised bulk data ingestion using PostgreSQL COPY over row-wise inserts, reducing load time by **10×**.

- Architecting each service with a single responsibility — model, API, and dashboard are independently deployable and replaceable, reflecting production microservices standards; live visualisation served via Neon serverless Postgres with zero infrastructure overhead.

5G Network Energy Consumption Forecasting ↗ [Link](#)

Feb - July 2025

Python · Time-Series Modelling · Regression · Feature Engineering · MSc Dissertation

- Modelled energy consumption patterns across 5G network infrastructure — applied feature engineering and timeseries regression to forecast consumption and identify efficiency opportunities.

TECHNICAL SKILLS

Languages	SQL · Python
Analytics	Data Preprocessing · EDA · Statistical Testing · A/B Testing · Cohort Analysis · Time-Series · Regression · Market Basket Analysis
Visualisation	Power BI · Streamlit · Matplotlib · Seaborn · Excel
ML / Modelling	Machine Learning, Deep learning, Natural language processing
MLOps & Infra	Docker · FastAPI · GitHub Actions (CI/CD) · AWS
Emerging	Agentic systems · RAG pipelines · Custom MCP server & client development · LLM tool integration

EDUCATION

MSc Data Science

Sept 2024 – Sept 2025

University of Surrey, UK · Merit · GPA 3.5 / 4.0
Dissertation: Energy Consumption Forecasting in 5G Network Infrastructure

BTech Engineering

Jan 2019 – Jan 2023

University of Kashmir, India · Upper Second Class (2:1)

CERTIFICATIONS

Deep Learning Specialisation	iNeuron · 2024
Natural Language Processing	iNeuron · 2024
